project work

structure

- 1 description of the dataset
- 2 data cleaning (if needed)
- 3 exploratory analysis
- 4 main analysis: objective and methods adopted
- 5 preview/summary of the results
- 6 detailed results
- 7 conclusions

the project work is composed of two parts

- a the presentation
- b supplementary materials and methods

a the presentation

- ▶ presentation to last 15 minutes
- ▶ all group members present one part of the project
- ▶ slides in power point or pdf
- ▶ no more than 15 slides

b supplementary materials and methods

- ▶ output of the elaboration: Python Jupyter notebook
- ▶ technical but sufficiently self explained to be readable and comprehensible (with comments,...)

important: tables, conclusions and analyses contained in the presentation must point to the material in supplementary!

- the size and details of part **b** is related to the type of project, there is no specific requirements, it must be of the right size!
- discussion of project work to be organized by each group with the teachers
- material to be sent few days before the exam
- scripts and code may be run from teachers, so **send clean and working code**
- **only** methods/models and packages **seen in the course** are allowed!
- students must justify their project choices in the presentation and in the discussion
- real-time experiments on the code can be asked during the presentation so take your code ready for running during the discussion

- the project can be presented only when all group members have passed the written exam
- if all members have passed the written exam, they can present the project even if one member want to repeat the written exam in a next call in order to improve the grade
- project work is **mandatory**
- if the quality of the project is too poor, it must be improved to pass the overall exam
- if the quality of the project is sufficiently good, a bonus on the final grade is obtained by the group members
